

Over half the prospective resources* in Mexico are concentrated in 2 basins

Published on November 8th 2017

By 2017, Mexico has a volume of 112.8 Bboe of prospective resources. Tampico-Misantla and Deep Gulf of Mexico basins combined represent 58% of these resources.

Tampico-Misantla's prospective resources are estimated at 37.1 Bboe, accounting for 33% of the total resources.

As for the Deep Gulf of Mexico, its resources are estimated at 28 Bboe, that represent 25% of the total resources.

Southeast Basins, Sabinas-Burro-Picachos and Burgos accumulate 38% of the prospective resources. While the basins of Veracruz, Yucatan Shelf and Chiapas Fold Belt constitute altogether barely 4% of the total.

Bboe: Billion barrels of oil equivalent.

*Prospective resource: volume of hydrocarbons in undiscovered accumulations, which is considered to be potentially recoverable according to the available information.

On the other hand, the term "Reserves" makes reference to the volume of hydrocarbons in discovered accumulations, foreseen to be commercially recovered.
