

Gas Flaring and Venting reduced by 73%

Associated gas flaring and venting

Published on October 3, 2017.

- In August 2017, Pemex flared and vented 128.2 million cubic feet per day (MMCFPD) of natural gas; this cut is also equivalent to a reduction of 352.4 MMCFPD in relation to August 2016. In perspective, the latter figure represents 9% of what was domestically produced in August 2017.
- Most of the reduction was achieved in the Ku-Malooop-Zaap asset with a participation of 173.1 MMCFPD, followed by the Abkatún-Pol-Chuc asset with a decline of 103.7 MMCFPD; these are equivalent to a reduction of 85% and 95%, respectively.
- This enhancement in gas usage takes place after the publication, in January 2016, of the Natural Gas Usage Technical Provisions by CNH as well as the corrective programs that have been implemented given these Provisions.
