

Non-associated natural gas basins at the lowest level of the last 15 years

Published on August 7th, 2017

- In the first half of 2017, production of the main non-associated natural gas basins* fell 57% from the level reached 10 years ago and is at its lowest point in the last 15 years.
- The drilling of wells in these basins has been in decline since 2006, which has directly impacted the production level. So far in 2017, no new wells have been drilled.
- The fall in the production of non-associated gas is related to the collapse of the price of this hydrocarbon, which lost 55% of its value in 10 years.

Million cubic feet per day (MMcf/d)

* Basins: Cuenca de Burgos, Plataforma Burro-Picachos, Sabinas and Veracruz.
